

Supplementary sensitivity and robustness of locked host-response modules

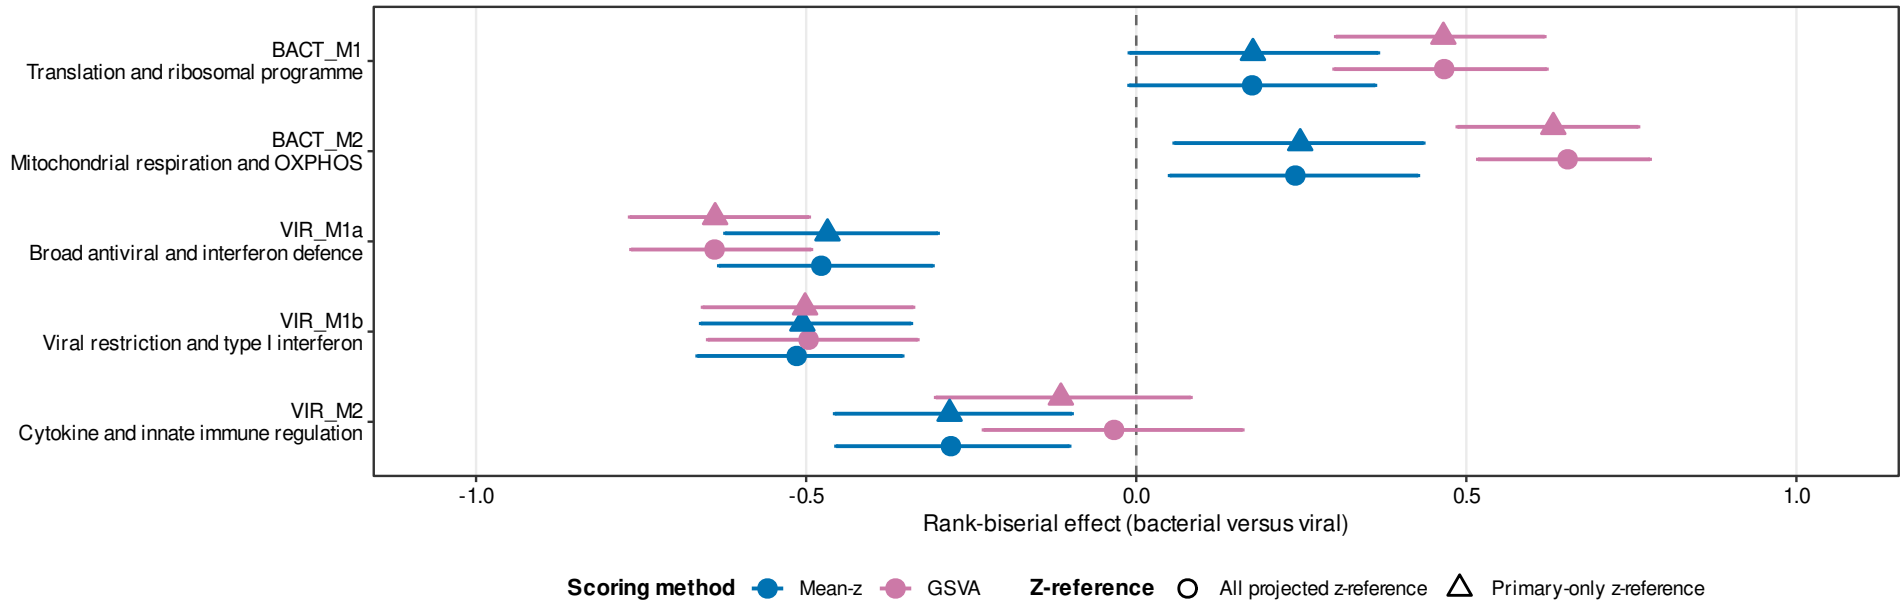

A Z-reference, case-definition and probe-collapse sensitivities

Rank-biserial effects with bootstrap 95% CIs; all 30 rows retained the expected direction; GSE72810 score Pearson $r \geq 0.987$

B GSE73461 mean-z versus GSVA scoring-method sensitivity

Rank-biserial effects with bootstrap 95% CIs; VIR_M2 loses support under GSVA, while BACT_M1 gains support

C Exhaustive leave-one/two-gene robustness in GSE73461

29,826 variants; 100% expected-direction retention; minimum Pearson $r = 0.9940$
